

Representative GPT-5.4 Raw Responses

Qualitative examples for VLM-based AR quality assessment

Example 1 — Size Assessment

android_Table2_70_ar.png

Raw GPT-5.4 response (verbatim)

"The virtual object appears to be a small desk or side table with drawers. Using the nearby Rubik's cube, bottle, wall outlet, and shipping box as references, it looks much too small for a normal desk or even a typical side table. Its tabletop is only a little larger than the Rubik's cube and its height is below the bottle's shoulder, which suggests a miniature scale rather than furniture meant for human use.

There's no contextual cue that this is intentionally a toy-sized or decorative miniature in a dollhouse-like setting—the surrounding room and objects are full-size and ordinary. So the atypical size does not seem especially appropriate to the scene.

Score: 2."

Example 2 — Shadow Assessment

android_Basket_11_ar.png

Raw GPT-5.4 response (verbatim)

"The virtual object appears to be a shopping basket/cart-like container that should rest on the countertop rather than float. In this scene, it looks visibly elevated above the surface: there is a clear gap between the basket's lower structure and the table, and the rendered shadow sits detached beneath it instead of tightly anchoring the object. That makes the placement feel misaligned rather than intentionally suspended.

Because this object type is not one that would normally hover, the floating behavior is not appropriate here. The shadow does help indicate where the system thinks the surface is, but it also emphasizes that the basket itself is not properly grounded.

Score: 1."
